

Understanding The effects Of Using A Pheromone To Attract Men And Women

Understanding the effects of using a *pheromone* to attract men and women requires an understanding of the role pheromones play generally in nature. Pheromones are powerful **chemical compounds** produced by various species. The primary function of a pheromone is silent communication. Each particular pheromone is designed to elicit a response of some kind within others of the same species.

While generally thought of in terms of using a pheromone to attract people, other species use these chemicals for a host of other uses. In insects, a pheromone may be used to speak that food lies in a particular direction. Other insects douse their eggs with pheromones to signal other mothers in order to lay their eggs elsewhere. The swarming behavior of bees is as a result of pheromone connection as well, most obviously used in the protection of a hive any time hazard is actually near.

- Mammals make use of their pheromones in order to encourage nursing in their young as well as to mark their territory.
- Marking, much like dogs, is actually facilitated by peeing in an area.
- The actual urine contains a pheromone compound that can be detected by other dogs, effectively claiming the location.
- Other mammals use pheromones to be able to elicit mating behaviors such as the arching of the female's back to help coitus.

But there is a difference between lower buy creatures and humans in that using a pheromone to draw men and women does not necessarily mean copulation will ensue. While other creatures are guided unerringly by impulse and their behavior is generally very susceptible to impact by pheromones, humans can be guided by their cognitive equipment as well as by chemical influences. This is most fortunate for our relationships, which are infinitely more complex than those of lesser species.

Using a pheromone to **attract women** and men can lead to an effect often not consciously recognized. If you've ever felt attraction to someone you have met, part of that attraction is due to the presence of that person's pheromones. Pheromones are sensed by a specialized body organ and interpreted by the brain. This silent communication can tell a man that a woman is fertile and available and will tell a lady that a man is strong and capable of caring for her and her progeny.

“

Is Replenishing of Pheromones Necessary Pheromones are bodily hormones produced as well as introduced in tiny quantities by the different glands of our body. Most are provided on the outer layer individuals body via our own natural delivery methods deciding in the surface of the skin....

- The **best pheromone** to attract men and women have Testosterone or it's derivatives.
- Both men and women produce testosterone and pheromones in differing quantities.
- Varying mixtures of these can be produced unnaturally to enhance a person's natural complement of pheromones.
- Many of these are usually optimized formulas and some allow testing.
- Care needs to be taken in either case not to use an excess, which can result in a slightly sweaty or even musky odor.

Insects Use Pheromones in Order to Lead One Another to Food and to Warn Others of Threats

Mammals use a pheromone to be able to activate the nursing instinct of their young. Even plants have uses for pheromones. Human beings can pick up on the pheromone compounds in the same as well as that of the opposite sex. Using a pheromone to draw in men and women is similar to using an **aphrodisiac**.
